Nederpelt & Geuvers §1.4: Free and bound variables

William Sollers

Notes, draft 1 (in progress)

Remark (Three kinds of occurrence). *Source.* N&G §1.4 (**verify** page).
Variable occurrences in λ-terms divide into three categories:

(i) free occurrences;

(ii) bound occurrences;

(iii) binding occurrences.

Example 0.1.

To write: One term with all three kinds, each occurrence labelled. Then the same variable occurring both free and bound.

Definition 0.2 (Free variables)**.**

To write: N&G's FV, by recursion on Λ, with its source line. Compare with Sub (Def. 1.3.5): same three cases, what differs in the abstraction case?
